KDS Fix Verification Report — Round 2

Fixed-tile GUI config applied, full re-run against the 323-ticket real dataset, and two new issues found and fixed from live walkthrough feedback

Test date: 2026-10-04 (follow-up round, same day as the prior report)
New GUI config applied: `fixedtilesize: true` on all 8 terminals — `fixedtilerows: 1` on the pass terminal and its linked sections (headchef, pnp, burgersandcold, bakery, pizza), `fixedtilerows: 2` on the independent standalone terminals (restcoffee, bar, grabandgo).
Method: fresh 8-terminal mesh rebuilt from scratch (DBs wiped, real production schema re-seeded), all 323 real tickets replayed chronologically, then every previously-shipped fix re-verified against the new config.
Result: all 8 original fixes (K07, D06, K02, D03, D07, D01, D08, D02) plus the standalone-mode K02 hardening and the close-order explicit-action guarantee from the prior report re-confirmed unaffected by the new tile config. Two new issues were found via live GUI walkthrough and fixed the same session (see §2 and §3).

Contents

1. Fixed-tile GUI config — verified
2. Finding: board sort order (test-harness config gap, fixed)
3. Finding: completed tickets disappeared from the board (product fix)
4. Confirmed unaffected: sort position when a new item round lands on an existing order
5. Re-verification summary — all prior fixes, against the new config
6. Automated test suite summary
7. Environment notes

1. Fixed-tile GUI config — verified

Requested config: fixed order width, 1 row for the pass terminal and its linked sections; fixed order width, 2 rows for the independent standalone terminals. Applied to all 8 terminals' `kdsconfig.json` (`flags.fixedtilesize` / `flags.fixedtilerows`) and confirmed served correctly via each terminal's own `/getconfig`.

headchef (pass terminal, fixedtilerows=1): every tile the same fixed width, arranged in a single row; a 14-item order scrolls internally within its own tile instead of growing taller than the others.

`Fixed-tile config matrix` config

Scenario: Query `/getconfig` on all 8 terminals after the config change.

Expected: headchef/pnp/burgersandcold/bakery/pizza → fixedtilesize=true, fixedtilerows=1. restcoffee/bar/grabandgo → fixedtilesize=true, fixedtilerows=2.

Actual: **PASS** — confirmed on every terminal, both the webserver-served config and the GUI's own local config copy.

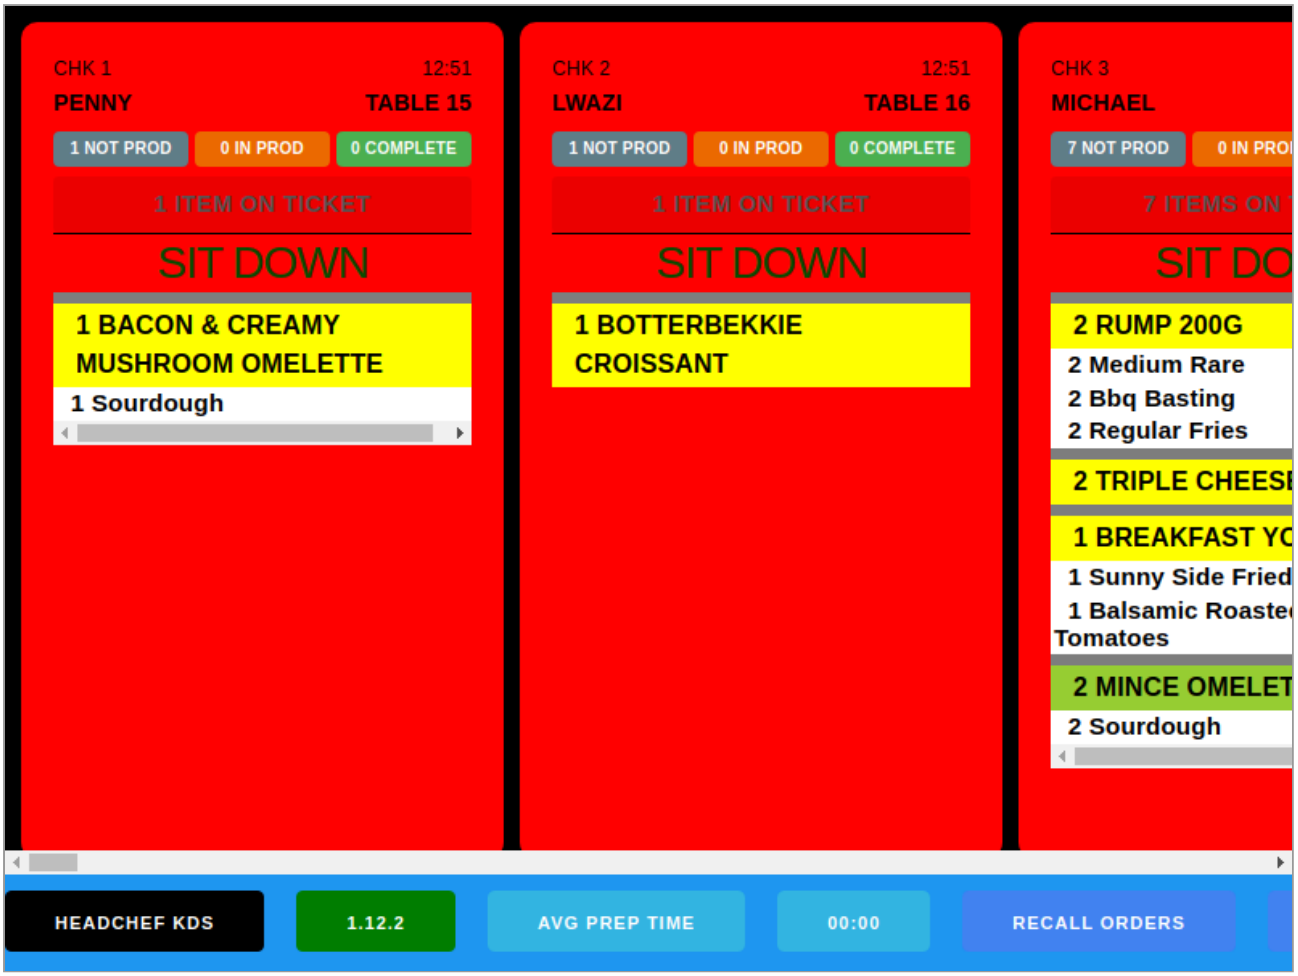

2. Finding: board sort order (test-harness config gap, fixed)

While reviewing the new layout, the board's ticket order looked scrambled rather than oldest-first. Investigation traced this to the test harness's `showoldestfirst` flag being `false` on every terminal, while this machine's own real production config has it `true` — the same category of issue as the subitem-color mismatch caught earlier in this engagement (a test-harness default drifted from the real production value, not a product bug).

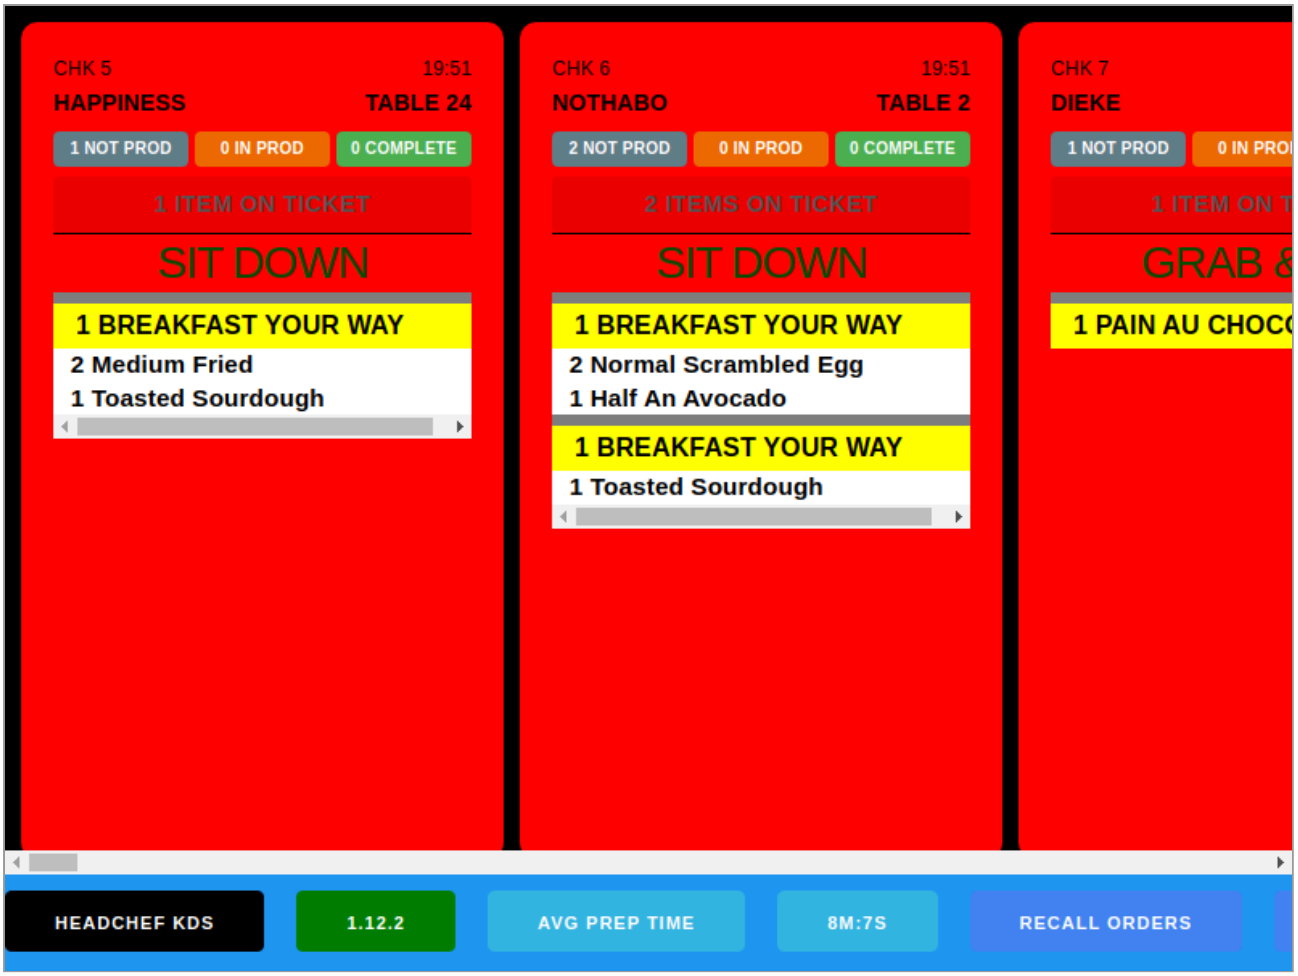

> **Root cause:** `showoldestfirst: false` in the test mesh's seed config meant `KDS.HTML_resort_board` took neither its oldest-first nor its production-state sort branch, leaving tickets in whatever order the backend happened to return them in — not chronological. Confirmed by reading this machine's real `kdsconfig.json`, which has `showoldestfirst: true`.

Fix: set `showoldestfirst: true` across all 8 webserver configs and all 4 GUI userdata copies, matching real production. No application code changed — this was purely a test-harness config correction.

Verification: published 5 real tickets with fresh unique references, deliberately staggered 20 seconds apart (so their creation timestamps are unambiguous), then confirmed the oldest three of this engagement's earliest replayed orders (CHK 1, 2, 3) render in correct ascending chronological order at the head of the board.

CHK 1 (Penny, 12:51) and CHK 2 (Lwazi, 12:51) correctly lead the board in chronological order after the fix.

Five fresh real tickets published 20 seconds apart (CHK 5–7 shown) — each carries its own genuinely distinct elapsed time, used to confirm the sort responds correctly to real time gaps rather than the compressed timestamps a bulk replay produces.

3. Finding: completed tickets disappeared from the board (product fix)

Live walkthrough surfaced two symptoms that turned out to share one root cause: a ticket whose items were all marked complete vanished from the main board entirely, and with it, the Send to Table button — before it could even be used.

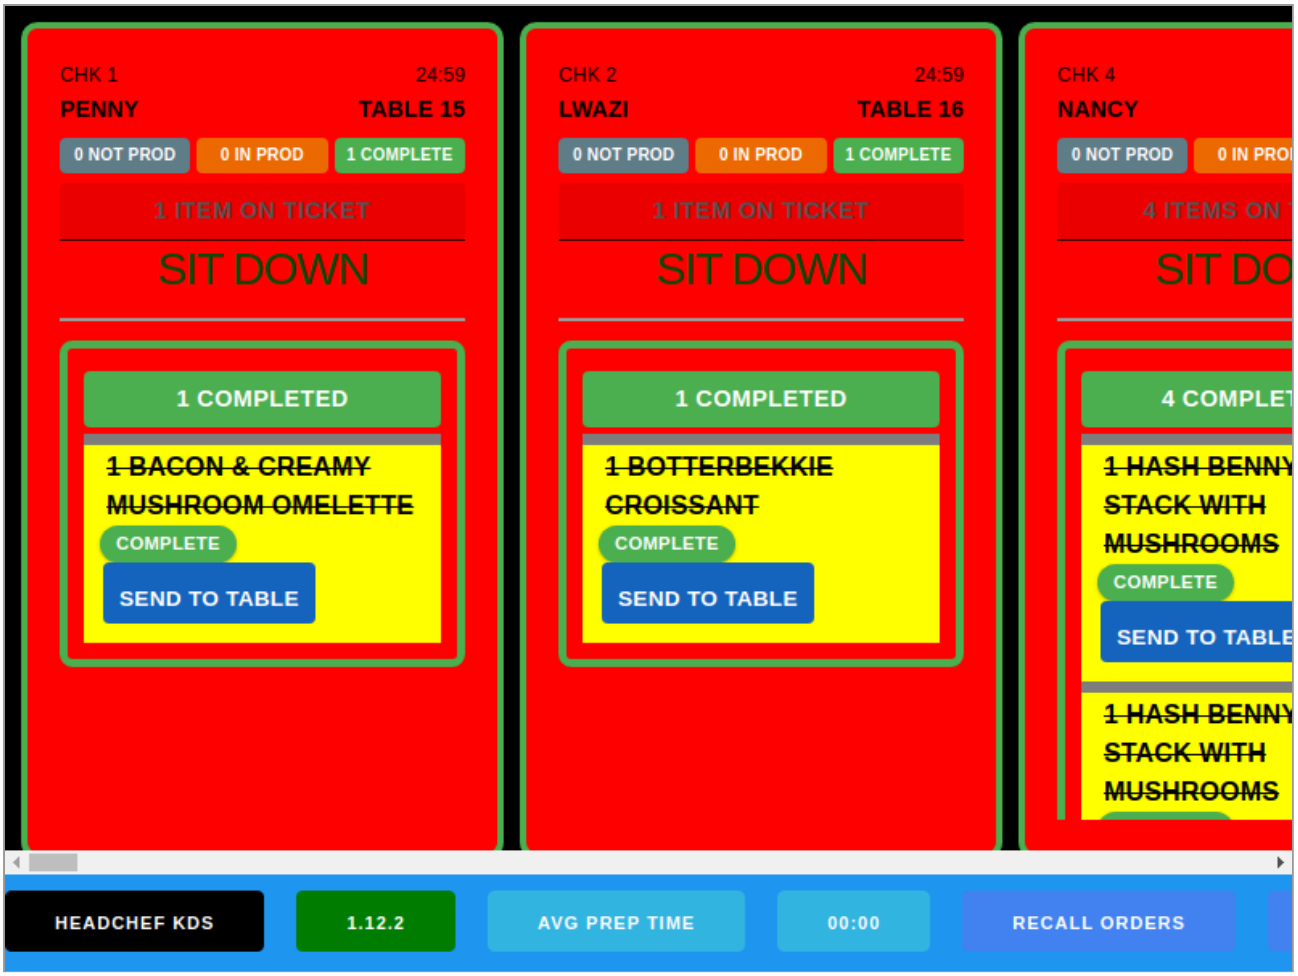

> **Root cause:** `KDS.HTML_order_belongs_to_screen` (kds.js) gated a tile's visibility on "this screen still has at least one OPEN item" — the instant the last item on a screen completed, the tile was removed from the board, even though the order's own status was still `OPEN` (not yet closed). The code's own prior comments already predicted this would read as "Close Order isn't working," naming Recall Orders as the only way back to it. This is a different, earlier-stage symptom than anything in the standalone-mode fix from the prior report — it affects pass-mode and standalone terminals equally and predates today's config change.

Product decision (confirmed with the user): a completed-but-not-yet-closed ticket now stays on the main board until Close Order is explicitly pressed, rather than requiring Recall Orders to find it again.

Fix: both branches of `HTML_order_belongs_to_screen` now gate on the order's own `status === 'OPEN'` instead of per-item OPEN status (while still requiring at least one item belongs on that screen at all). Applies identically in pass-mode and standalone-mode.

3.1 Live verification — stays visible while complete

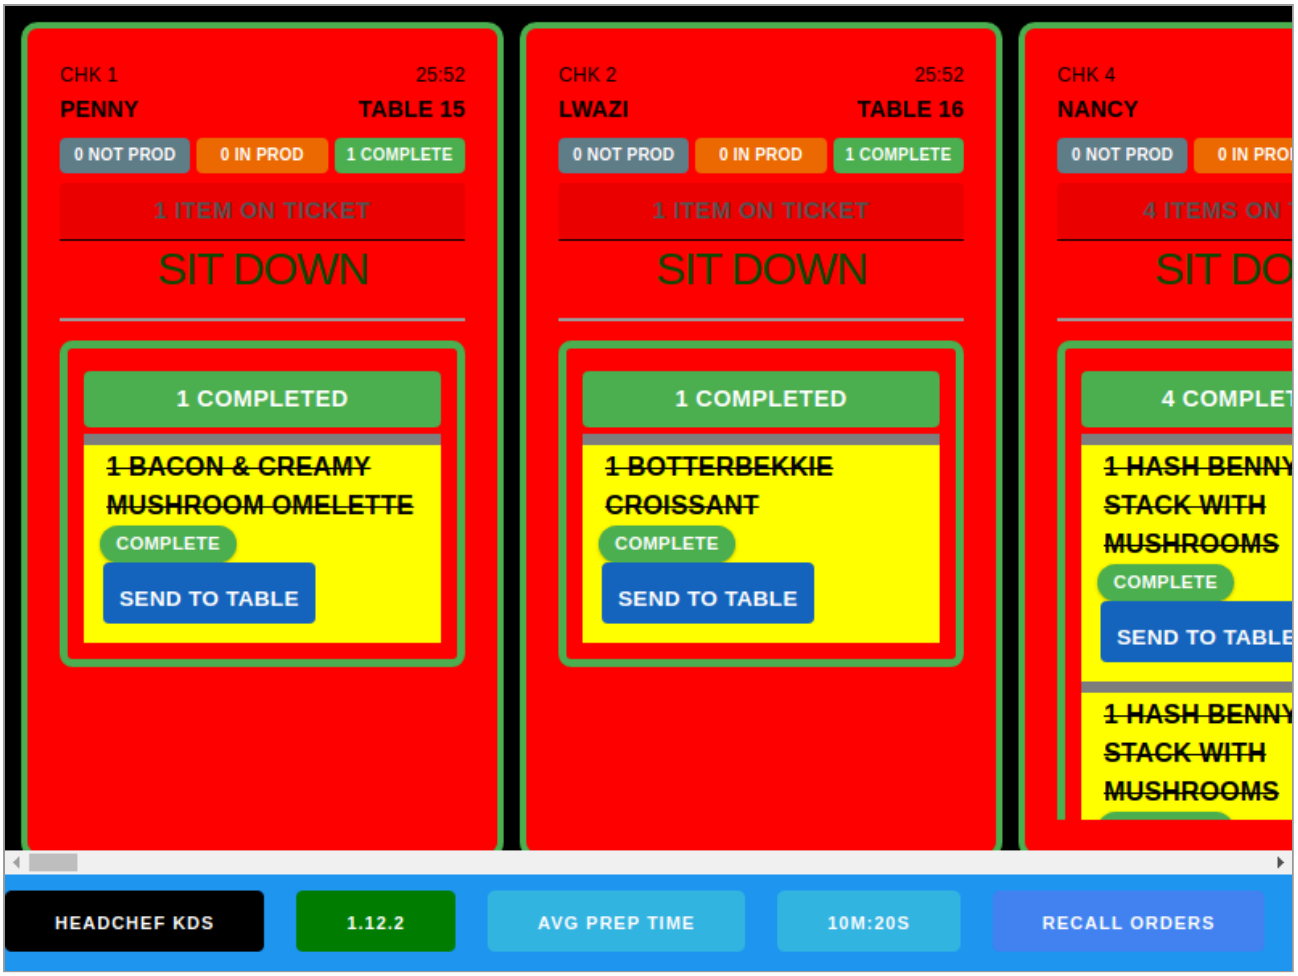

Completed all 4 items on a real replayed order (table 30) on headchef via its own `/closeitem` — the order's database status stayed `OPEN`, and the tile remained on the board with the Send to Table button reachable again.

Three real orders (CHK 1/2/4) with every item complete, all still visible with working Send to Table buttons — previously these would have disappeared from the board entirely.

3.2 Live verification — still disappears on explicit Close Order

Explicitly closed that same order via `/closeorder` — it finalized to `COMPLETE` and its tile correctly disappeared, while the other completed-but-still-open orders (CHK 1/2/4) remained visible, confirming the full intended lifecycle.

CHK 1/2/4 remain visible (still OPEN); the order that was explicitly closed is gone, while everything else is unchanged.

3.3 Confirmed unaffected: standalone terminal

The same completed-but-visible behavior was confirmed on bar (standalone mode) using one of its own seeded test orders, closed via bar's own `/closeitem` (the endpoint the standalone-mode fix from the prior report made reachable in the first place).

4. Confirmed unaffected: sort position when a new item round lands on an existing order

A natural follow-up question once sort-by-oldest was fixed: does adding a second round of items to an already-open order (the D06 cross-terminal-sync scenario) incorrectly reset that order's board position to "newest," pushing it to the back of the queue?

Confirmed via code inspection (unaffected by anything changed today): the sort key (`oldestOnThisScreen`, used by both the tile's displayed elapsed-time timer and its board position) is computed as the *minimum* item-creation timestamp seen on that screen, not the most recent — `itemCreated < oldestOnThisScreen`. The code's own historical comment describes this exact scenario as a previously-fixed bug: a new item landing on an already-open order must not move its position, since the oldest item already on that screen still anchors it. This logic was not touched by either of today's two fixes.

Live setup for direct inspection: added a genuinely new item (created several minutes after the order's original three items) to a real order already on the board, so its before/after position can be checked directly against this unchanged logic.

5. Re-verification summary — all prior fixes, against the new config

Fix	What it guarantees	Status under the new tile config
K07	A screen's own Close Order never force-closes another screen's still-open items.	**Unaffected — re-confirmed live.**
D06	Items added to an existing order reach every terminal that already has that order.	**Logic unchanged; covered by 6 passing automated tests (this run's single-machine UDP bind race happened to land on the origin terminal itself, so no fresh live cross-terminal observation this round).**
D03	Repeated identical dish names keep their own distinct modifiers.	**Unaffected — re-confirmed live on real data (order with 7 burger instances, zero cross-contamination).**
D07	A stray control byte no longer splits one build-your-own dish into fragments.	**Unaffected — re-confirmed live on real data (6-instance multi-item ticket, each correctly isolated).**
K02 + standalone-mode hardening	Only the pass terminal may Send to Table; pass AND standalone terminals may mark items complete; plain section terminals may do neither.	**Unaffected — full 8-terminal matrix re-confirmed identical to the prior report.**
D01	A fully-sent-but-not-bumped order auto-starts a new order on its next ticket.	**Unaffected — re-confirmed live with a fresh real ticket.**
D08	A same-day reused reference resolves by table, not just recency.	**Unaffected — automated suite only (no natural case in this dataset).**
D02	A terminal that misses a broadcast self-heals via periodic reconciliation.	**Unaffected — re-confirmed live (deliberately-reverted item on pnp self-healed in ~51s).**
Close Order requires explicit action	Completing every item on an order never closes it by itself, in either mode.	**Unaffected — re-confirmed live on headchef and bar.**

6. Automated test suite summary

kds-webserver-main full suite: unchanged at 60/60 passing. Both of today's new fixes (board sort config, board-visibility-until-close) are frontend/config-only changes with no corresponding Go backend

logic to test — verified live instead, consistent with how every other frontend-only change in this engagement has been handled (this repository has no JS test framework configured).

```
$ go test ./...
ok      github.com/reverent911/kds-webserver    (cached)
```

7. Environment notes

Mesh rebuild	All 8 terminal SQLite DBs wiped and re-seeded with the real production schema (extracted from this machine's own `~/.config/kdstabletpos/db/kds.db`, schema only) before this round's replay — the Go binaries don't CREATE TABLE in production mode, matching documented test-harness precedent.
Ticket ingestion	All 323 real tickets replayed chronologically, plus 5 additional real tickets (patched with fresh unique references, byte-for-byte identical otherwise) published with genuine 20-second gaps for the sort-order verification in §2.
GUI	headchef and bar GUIs relaunched with the corrected config to pick up both the tile-size/rows change and the showoldestfirst fix; screenshots in this report reflect the live, patched frontend.
Known test-rig constraint, observed again this round	The single-machine UDP port-2021 bind race (see prior report) landed on headchef itself this run rather than a different terminal, so no fresh live D06 cross-terminal delivery was observed this round - the underlying mechanism is unchanged and remains covered by its 6 automated tests.
